

MecaTech Cluster

Mechanical engineering relies on a wide spectrum of scientific knowledge and technological expertise (materials, nanotechnology, forming technologies, simulation tools, mechatronics, optoelectronics, integration of organic materials, biomimicry, ...).

The combination of these technologies and sciences leads to the hybridization of technologies and to very promising breakthrough innovations. It is impossible for companies to have all the needed technologies and knowledge inhouse.

Consequently, innovation networks have become vital.

The MecaTech Cluster aims to increase the partnership between the realms of industry, research and training in order to improve the competitiveness of Wallonia through innovating projects.

In practice, we facilitate the creation of new synergies to improve the capacities of the companies, to increase the investments in the industrial projects, and to support the development of highly qualified personnel.
